- Required date of delivery before 31/12/2019

Our sales and marketing employees are ready to answer any of your questions.

**DIGGER is your solution
for any conditions!**

The DIGGER deep cultivators have become indispensable machines for many farmers. The title “chisel ploughs” exactly defines the advantages of the universal DIGGER cultivators:

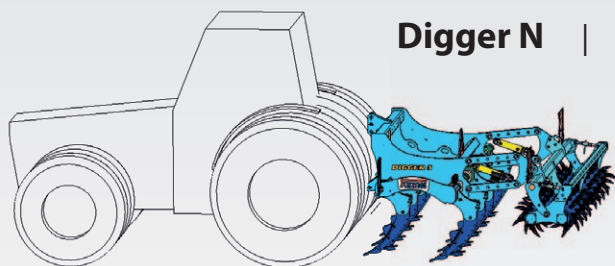

- They substitute demanding and less productive ploughing.
- They work reliably and penetrate soil perfectly, even under very hard conditions.
- They revitalise soil by deep cultivation, breaking of the plough bottom and restoring the water soil system. They mobilize (reactivate) nutrients in a single pass.
- They recess reliably and equally, even with a large quantity of crop residue.
- The quality of soil cultivation enables direct subsequent sowing with combined seed drills.
- They demonstrably increase the crop of all main products.
- The selected types enable the application of fertilizers at two levels of depth.

Their versatile use is made possible by an extensive offer of optional equipment that includes various types of protection, fertilization options, selection of embedding discs etc.

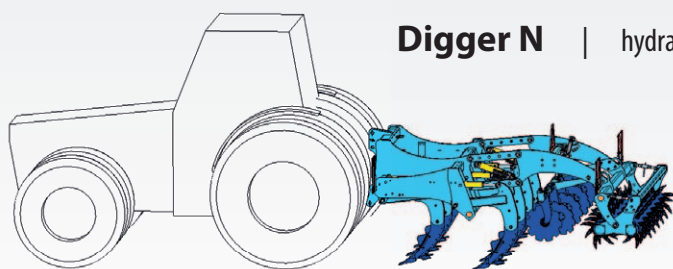

We strive to make use of the increasing interest of farmers and to improve our position on the market with these machines. Therefore, we are introducing another expansion of our optional equipment and this special offer for the whole DIGGER series.

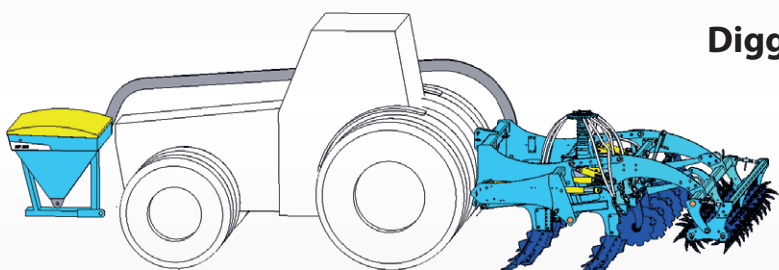

DIGGER BASIC VERSIONS

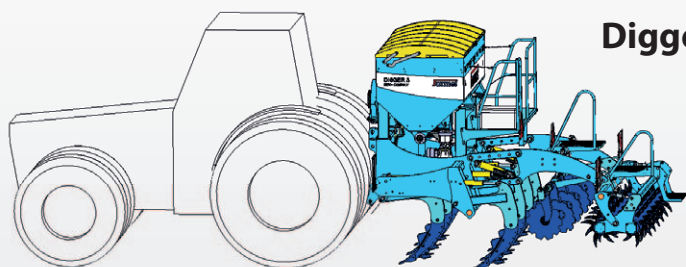

Digger N | shear segment protection

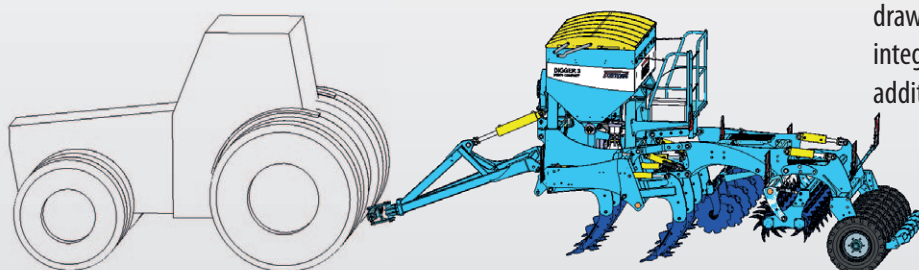

Digger N | hydraulic protection

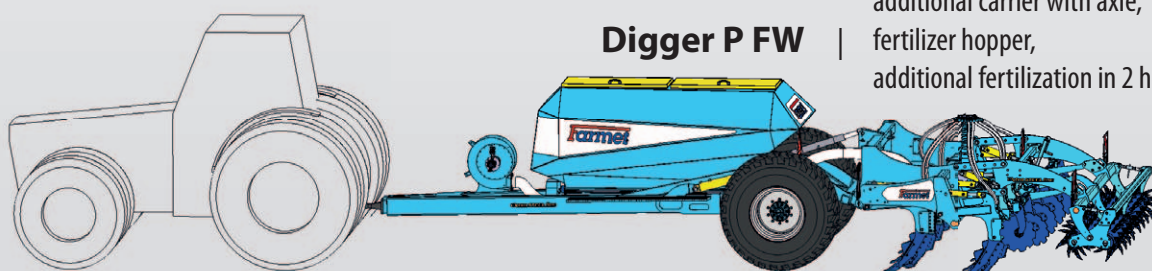

Digger N Fert+ | front fertilizer hopper,
additional fertilization in 2 horizons
